

## Assignment 1 11 book is the togling out winter motor vil Title: Write X86/64 ALP to court number of positive and negative numbers from the array. Objective: To understand how to identify a positive number or negative number. Outcome Students will be able to use different index registers and find positive and regative numbers from array. Theory: A system call is essentially a function call which changes the CPV into kernel mode and executes a function which is point of the kernel. When you run a process on linux it runs is user made which means that it is limited to executing only "safe" instructions. It can move data within the program, do arithmetic, do branching, call functions etc. I not there are instructions which your program can't do directly. For example it would be unsafe to allow only program to read or write directly to the disk device, so this is prevented by preventing user programs from exauting input or output instructions. System calls which are generally used are: Theory:

	Bit Test Instruction (BT)
	It takes several instructions to entract
	or insert a bit field. Sometimes you need to extract or insert a single bit. However it can be simple and quicker to use the bit test
	extract or insert a single bit. However it can be
	single and quicker to use the lift test

instruction (bet) and either the bid test and set instruction (bits) or the bit test and reset instruction (Uts) The bit instruction has 2 operands. The first operand is a 16, 32 or 64 bit coord in memor or a register which contains the The second operand is the bid number from o to number of bits minus I for the word size which is either an immediate value or value in a register. The bt instruction set the carry flag to the value of the bit being tested. In computer system, the negative number is represented by different ways: s) Sign-Magnitude representation: It is simply an ordinary binary one digit placed in front to represent the vert of the digit represent a mumber. However if the same set are used but the estra digit is a that the number is a positive one Example: 0100 = +4. 1100 = -4
